

DeFi Track | Arc Testnet

Arc USDC Rebalancer

Policy-bound treasury decisions before execution.

Arc + USDC + Circle Wallets + Gateway

Public MVP is read-only. No treasury transaction has been submitted.

out 30 seconds.

3, identity evidence, and Circle readiness. Policy, balance, or Circle read failures degrade to a clearly marked safe result; id

d with 0.0000 USDC available on the executor path.

CLE **live**

le control-plane readiness read live.

IDENTITY **configured**

Identity uses the verified deployment configuration; it is not re-read for every brief.

POLICY **live**

Treasury policy read live from Arc Testne

History collecting

Read only

Operational history

Scheduled snapshots record only sanitized policy, bala signing material is stored.

SAFETY GATES

9/9

Treasury teams need a defensible decision before moving USDC.

LIVE INPUTS

Arc policy and executor balance
Circle control-plane readiness
Source quality on every read

THE BOUNDARY

The MVP produces evidence and a bounded recommendation. It does not expose a signer or treasury write path.

One Arc policy produces three bounded outcomes.

Policy: minimum 100 USDC | target 500 USDC | cap 200 USDC

75 TOP UP 200

500 HOLD

700 TRIM 200

Every amount is capped by policy and exported for review.

DD BOUNDARY

ministic balance sweep and synthetic cash-flow stress replay; no historical treasury dataset available.

inputs

Policy ready

your treasury now

draft values for preview mode, or load the onchain policy before relying on the decision report.

balance

USDC

review input. It is not the live executor balance shown in the Treasury Brief above.

minimum

At target

Above target

Treasury is inside the policy band.

the policy band; 0.0000 USDC from target.

anced policy inputs & live source

tion pack

Vercel Hobby supports one daily baseline run. The protected collector endpoint can be called n frequently by an approved scheduler without exposing the secret publicly.

Treasury decision

Copy this into chat, docs, or GitHub. It is the smallest useful output this site can produce.

Hold

Readiness 3/4

Treasury is inside the policy band.

Treasury is inside the band at 500.00 USDC. Hold and keep monitoring.

Decision basis: Inside the policy band; 0.0000 USDC from target.

View decision evidence

NEXT STEPS

Keep monitoring and share the report if you need a review trail.

Copy action pack

Download JSON

Execution locked

Public deployment is read-only; signed execution is not available here.

• Public deployment is read-only; no treasury transaction is submitted.

Operator readiness

Execution locked

Above target

Public deployment is read-only

The dashboard reads Arc and USDC evidence, produces a bounded decision, and exports a reviewable action pack. It never exposes a treasury write path.

WALLET SIGNING

Disabled

Public deployment never connects an operator wallet.

LIVE POLICY

Loaded

Live onchain snapshot is active.

CIRCLE WALLET SET

Ready

65b02aa0-10f5-58fb-aadf-84827226289a

EXECUTOR

Configured

0x5c5d0275371724779f3a6928eb0312df2b1a501f

EXECUTION

Locked

Read-only preview remains report-first.

USDC read live | Public write path locked | No transaction submitted

The control loop is reproducible, and the transfer count is zero.

[Case study](#)

Arc USDC Rebalancer

Open treasury

A short public path for operators: what this repo proves, how to replay it, and what to inspect first.

[Verified treasury reference build](#) [3-minute review](#) [1-minute local run](#)

What this project proves

A 1-only Arc Testnet USDC treasury decision MVP with deterministic verification and an auditable evidence path. The point of this page is to make the verified demo easy to replay without opening every surface first.

REVIEWER SIGNAL

Operators can open one public page and see the short path, the live policy path, and the error gate without guessing where to click next.

OUTPUT

The dashboard emits a copyable readiness report and a deterministic decision receipt for review in chat, docs, or GitHub. The receipt is not an onchain record unless a future transaction hash is published.

SURFACE

Arc Testnet policy, Circle readiness, executor state, and onchain identity evidence are visible in one flow.

REPLAY

You can replay the same flow locally in read-or-preview mode; no operator wallet is required.

[Test verified](#) [No transactions submitted](#)

Reproducible decision and safety evidence

CLI, automated test, API, and this page all use the same shared backtest implementation.

PLANNED CASES
1,003

AGREEMENT
100.00%

SAFETY GATES
9/9

CAP VIOLATIONS
0

1,003 deterministic balance sweep and synthetic cash-flow stress replay; no historical treasury dataset was available.

1,003

deterministic balance cases

100.00%

expected-action agreement

0

transactions submitted

Synthetic stress replay, not a historical treasury performance claim.

A natural fit for the DeFi Track.

MEANINGFUL ARC + USDC

Live policy and executor-balance reads drive every recommendation.

TREASURY WORKFLOW

Top up, hold, or trim is bounded by policy and exported as evidence.

CIRCLE PRODUCTS

Developer-controlled Wallets and Gateway are live readiness signals, not proof of transfer.

The screenshot displays the 'Arc USDC Rebalancer' interface. At the top, the title 'Arc USDC Rebalancer' is followed by a subtitle: 'Decision engine, agent, policy, execution rail, authorization guard, and deployment evidence fit together.' Below this, there are three status buttons: 'Report first' (highlighted in green), 'Execution disabled in public deployment', and 'Auditable controls'. The main heading is 'Verifiable treasury control system', with a descriptive paragraph: 'Report-first treasury decision flow on Arc Testnet. The public deployment reads live data, and Circle readiness, but does not submit treasury transactions. Its write path is fail-closed.' Below the heading is a grid of six links, each with an 'Open' button and an external link icon:

- Dashboard: <https://web-eight-chi-99.vercel.app/dashboard>
- System Architecture: <https://web-eight-chi-99.vercel.app/architecture>
- Treasury Operations: <https://web-eight-chi-99.vercel.app/treasury-operations>
- Release Notes: <https://web-eight-chi-99.vercel.app/notes>
- GitHub Repo: [sin199/arc-usdc-rebalancer](https://github.com/sin199/arc-usdc-rebalancer)
- Case Study: <https://web-eight-chi-99.vercel.app/case-study>

At the bottom, there are two sections:

- What it includes**: A short description: 'In short; this page explains the system behind it.' Below this is a link to a 'treasury demo with a report-first readiness checker.'
- Why it matters for Arc**: A description: 'The architecture should be understandable from product action to onchain execution.' Below this is a statement: 'It turns the treasury flow into something a reviewer can inspect in one pass.'

Proof before execution.

Open the dashboard. Verify the policy. Replay the decision.

Dashboard
